Training Course Documentation

Word & PowerPoint AI Skills — Session 3 Practical Exercises

Overview

Starting File:

Finance-Demo-Model-Solution-Final.xlsx — the completed Session 2 Excel model containing tbl_Financials (7,812 rows), Dynamic Extracts with LAMBDA's, management reports, forecast accuracy, scenario manager, driver analysis, and executive summary.

Solution File:

Accounting and Management Report Solution Output v1.02.docx (Word report) + Management Reporting and Board Pack v1.03.pptx (PowerPoint board pack). Both are created from scratch by Claude using the Excel model as the single source of truth.

Data Structure:

3 entities (Americas, EMEA, APAC) × 8 P&L accounts × 3 scenarios (Actual, Budget, Forecast) × 36 months (Jan 2024 – Dec 2026). The Excel model's 13. Output sheet, Scenario Manager, and Driver Analysis provide the structured data that feeds into both the Word report and PowerPoint board pack.

Key Infrastructure:

Claude multi-agent architecture: the Excel agent reads source data and shares it via JSON files to the connected Word and PowerPoint agents. Each agent operates independently within its application, receiving data through the shared file system and building documents using native Office.js APIs. No manual copy-paste is required — the entire pipeline is prompt-driven.

Phase 1: Word Management Report Creation

Skill: /word-management-report | Document Built: Accounting & Management Report

What Was Built

A professional accounting and management report structured as a formal Word document. The report includes an executive summary with key performance indicators, a consolidated P&L with Actual vs Budget vs Forecast columns, entity-level breakdowns for Americas, EMEA, and APAC, variance analysis with commentary, and a financial highlights section.

The document uses a proper heading hierarchy (Heading 1 for major sections, Heading 2 for sub-sections), formatted tables with financial number formatting, and professional typography throughout. Headers and footers include document title, date, and page numbers.

All financial figures are sourced directly from the Excel model — no numbers are typed manually. Claude reads the Excel data via the multi-agent shared file system and writes it into Word tables and body text.

Key Techniques

Reading Excel cell ranges via the connected Excel agent and parsing structured JSON data for insertion into Word tables and body paragraphs.

Using Word heading styles (Heading 1, Heading 2) to create a navigable document structure that auto-generates a table of contents.

Inserting formatted tables with `insertTable()` — including header row styling, number formatting (thousands separator, brackets for negatives), and column alignment.

Applying consistent document formatting: font selection (Calibri 11pt body, Calibri 13pt headings), paragraph spacing, page margins, and professional colour palette (#17365D for headings).

Adding headers and footers with dynamic page numbers using `insertField('Page')` — real Word fields that update automatically, not hardcoded text.

Design Decisions

Executive summary leads the document — the reader sees KPIs and key findings before detailed tables. This mirrors best practice for management reporting where decision-makers read top-down.

Financial data is presented in tables rather than inline text. Tables allow side-by-side comparison (Actual | Budget | Forecast | Variance) and are easier to scan than narrative paragraphs containing numbers.

Entity-level breakdown follows the consolidated view — Americas, then EMEA, then APAC — each with its own P&L table and variance commentary. This structure supports both group-level and entity-level analysis.

Variance commentary is generated alongside the numbers, not in a separate section. Each entity's table is immediately followed by analysis of material variances, so the reader doesn't need to cross-reference between sections.

The document is designed to be print-ready — page breaks between major sections, consistent margins, and no orphaned headings at page bottoms.

Phase 2: PowerPoint Board Pack Creation

Skill: /ppt-board-pack-build | Presentation Built: Management Reporting Board Pack

What Was Built

A management reporting board pack presentation with 8–10 slides designed for senior leadership and board-level audiences. The deck includes a title slide, executive summary with KPI tiles, consolidated P&L overview, revenue and expense trend charts, entity performance comparison, scenario analysis (Base / Upside / Downside), and a recommendations slide with next steps.

Each slide is data-driven — all financial figures, charts, and KPI values are sourced from the Excel model via the multi-agent data bridge. The presentation uses a professional colour palette with dark green header bars (#1A3C2E) and clean white slide bodies.

Charts are created as native PowerPoint objects using OOXML chart specifications, not pasted images. This means they can be edited, resized, and updated directly within PowerPoint after creation.

Slide Design & Layout

Title slides use a dark green (#1A3C2E) background band with white text for the presentation title and subtitle. Date and presenter name sit below in a lighter accent.

Executive summary slides feature KPI tiles — rounded rectangle shapes with a key metric value (large font), a label (small font), and a period-over-period indicator (▲/▼ with green/red colour coding).

Financial data slides use a split layout: chart on the left (60% width) and supporting table or commentary on the right (40% width). This balances visual impact with detail.

Entity comparison slides use side-by-side bar charts with consistent colour coding per entity (Americas = blue, EMEA = green, APAC = orange) across all slides for instant recognition.

Charts & Data Visualisation

Revenue trend line chart: monthly revenue across 36 months with Actual (solid line), Budget (dashed), and Forecast (dotted) overlaid. Y-axis formatted in thousands with consistent scale across entities.

P&L waterfall chart: Revenue → COGS → Gross Profit → Operating Expenses → Net Profit, showing how each component builds or erodes the final result. Positive movements in green, negative in red.

Entity comparison clustered bar chart: Americas, EMEA, and APAC side-by-side for key metrics (Revenue, Gross Margin %, Net Profit), enabling instant cross-entity comparison.

Scenario comparison: Base, Upside, and Downside scenarios shown as grouped bars with variance labels, helping the board understand the range of possible outcomes and key sensitivity drivers.

Teaching Points

PowerPoint is a visual medium — the same data that fills a Word table should become a chart or KPI tile in the deck. The skill is knowing which format suits which audience: tables for detailed review, charts for pattern recognition, KPI tiles for at-a-glance status.

Claude creates native OOXML charts, not screenshots. This matters because native charts remain editable — the presenter can adjust colours, labels, or data ranges after creation without returning to the AI.

Slide density matters: board-level slides should have no more than one key message per slide. If a slide needs a paragraph of explanation, the content should be split across two slides or moved to the appendix.

Consistent formatting across all slides (fonts, colours, chart styles, alignment) is non-negotiable for professional board packs. Claude applies a slide master template so every new slide inherits the same look.

Key PowerPoint Techniques

Creating charts from structured data using OOXML chart parts — defining series, categories, and values programmatically rather than using the PowerPoint chart wizard.

Building KPI tile layouts with grouped shapes: rounded rectangle background, large-font value text, small-font label, and a colour-coded indicator shape — all positioned precisely using EMU coordinates.

Inserting and formatting tables on slides with PowerPoint's table styles — header row formatting, alternating row colours, right-aligned numbers, and merged cells for section headers.

Using slide layouts and masters to ensure every inserted slide inherits the correct background, placeholder positions, and font defaults — preventing the 'every slide looks different' problem.

Exporting chart images from Excel (via `getImage()`) and inserting them as high-resolution inline pictures when native chart creation isn't supported on the platform.

Phase 3: Multi-Agent Coordination

Skill: /multi-agent-bridge | Feature Built: Cross-Application Data Flow

What Was Built

A cross-application data pipeline that moves financial data from the Excel model into both Word and PowerPoint without manual copy-paste. The Excel agent reads source data (P&L figures, entity breakdowns, scenario outputs, KPIs) and writes it to shared JSON files. The Word and PowerPoint agents each read the relevant files and build their documents independently.

The data bridge handles format translation — the same underlying numbers appear as formatted table cells in Word, chart data points in PowerPoint, and KPI tile values on dashboard slides. Each agent receives only the data it needs, structured in the format it expects.

The system also supports bidirectional communication: the Word agent can request specific data ranges from Excel, and the PowerPoint agent can ask the Excel agent for chart-ready data series. This makes the workflow conversational rather than one-directional.

Architecture

Excel Agent (source): Reads `tbl_Financials`, `Scenario Manager`, `Driver Analysis`, and `13. Output`. Writes structured JSON files to the shared file system — one file per data request (e.g., `consolidated-pl.json`, `entity-breakdown.json`, `scenario-comparison.json`).

Word Agent (consumer): Reads JSON data files, parses the structured data, and writes it into Word tables, body paragraphs, and commentary sections. Maintains the document's heading structure and formatting throughout.

PowerPoint Agent (consumer): Reads JSON data files and chart image files. Creates slides with native charts where supported, falls back to high-resolution image insertion where native chart APIs aren't available.

Shared File System: Acts as the communication layer between agents. Files are written with `conductor.writeFile()` and read with `conductor.readFile()`. File naming convention: `{data-type}-{scope}.json` (e.g., `pl-consolidated.json`, `kpi-summary.json`).

Sequencing: Excel agent runs first (data extraction), then Word and PowerPoint agents run in parallel (document creation). Each agent confirms completion via `send_message` back to the orchestrating agent.

Teaching Points

Multi-agent workflows require clear data contracts — the Excel agent must know exactly what format the Word and PowerPoint agents expect. Ambiguous data sharing leads to formatting errors and missing values.

JSON is the preferred format for structured financial data (P&L rows, KPI values) because it preserves field names and data types. CSV works for simple tabular data but loses context about what each column represents.

Always verify the data landed correctly after each transfer. The receiving agent should read back what it inserted and confirm the figures match the source — a single transposition error in a board pack undermines credibility.

Multi-agent coordination is the highest-leverage AI workflow in finance: one prompt to the Excel agent triggers a cascade that produces both a Word report and a PowerPoint deck. The trainee's job shifts from creating documents to orchestrating and validating them.

Error handling matters — if the Excel agent disconnects mid-transfer, the Word agent needs to detect the incomplete data and report it rather than producing a half-populated report. Always check that connected peers are available before starting a multi-agent workflow.

Phase 4: Quality Assurance & Final Output

Skill: /cross-validation-qa | Feature Built: Output Validation & Quality Checks

What Was Built

A systematic quality assurance framework that validates every financial figure across all three documents (Excel source, Word report, PowerPoint deck). The QA process checks numerical accuracy, formatting consistency, and cross-document alignment.

The validation covers four dimensions: (1) Word report figures tie to Excel source cells, (2) PowerPoint chart values and KPI tiles match Excel, (3) Word and PowerPoint present consistent figures for the same metrics, and (4) all calculated values (margins, growth rates, variances) are arithmetically correct.

Word Report Checks

Consolidated P&L totals in Word tables match SUMIFS against tbl_Financials for each scenario (Actual, Budget, Forecast). Revenue, COGS, Gross Profit, Operating Expenses, and Net Profit are verified independently.

Entity-level figures (Americas, EMEA, APAC) each reconcile to their filtered subset of tbl_Financials. The sum of all three entities equals the consolidated figure — any difference indicates a filtering or aggregation error.

Variance calculations (Actual vs Budget, Actual vs Forecast) are arithmetically correct: $\text{Variance} = \text{Actual} - \text{Budget}$, $\text{Variance \%} = \text{Variance} \div \text{Budget}$. Favourable variances are positive for revenue, negative for costs.

No placeholder text remains — all [PLACEHOLDER], [TBD], or [INSERT VALUE] markers have been replaced with actual data. The document reads as a finished report, not a template.

PowerPoint Content Checks

KPI tile values on the executive summary slide match the corresponding cells in the Excel model. Revenue, Net Profit, Gross Margin %, and entity-level metrics are spot-checked against source.

Chart data series contain the correct number of data points (36 months for trend charts, 3 entities for comparison charts, 3 scenarios for scenario charts). Missing or extra data points indicate a data extraction error.

All chart axes are correctly labelled and scaled — Y-axis shows currency values in thousands with appropriate scale, X-axis shows months or entities in the correct order.

Slide titles accurately describe the content — a slide titled 'Revenue Trend' actually shows revenue, not net profit. Mismatched titles and content are a common AI output error.

Cross-Document Consistency

Total revenue in the Word report executive summary = Total revenue on the PowerPoint KPI tile = SUM of revenue in tbl_Financials filtered to Actuals. All three must match to the cent.

Entity rankings are consistent — if Americas is the largest entity by revenue in the Word report, it must also appear as the tallest bar in the PowerPoint entity comparison chart.

Time periods are labelled identically: if the Word report says 'H1 CY2026', the PowerPoint deck must use the same label, not 'Jan–Jun 2026' or 'First Half 2026'.

Scenario names (Base, Upside, Downside) and their underlying assumptions are described consistently across both documents. The Word report's scenario narrative must align with the PowerPoint scenario comparison slide.

Source Data Tie-Out

Every financial figure in both the Word report and PowerPoint deck must trace back to a specific Excel cell, range, or formula result. The QA reviewer should be able to click any number and identify its source.

Calculated values (gross margin %, revenue growth %, variance %) are re-derived from the underlying components to confirm arithmetic accuracy. A margin of 42.3% must equal $\text{Gross Profit} \div \text{Revenue}$ when calculated independently.

Period-specific values (monthly, quarterly, annual) use the correct date filters. A 'Q2 2026' figure must sum exactly April + May + June 2026 — not include March or July.

Rounding is applied consistently: if the Word report shows figures in thousands (\$'000), the PowerPoint deck must use the same rounding. A Word table showing \$14,244k and a PowerPoint KPI showing \$14.2M for the same metric creates confusion.

The final sign-off checklist: (1) All tables reconcile to source, (2) All charts use correct data, (3) Both documents show identical figures for the same metrics, (4) No hardcoded numbers without a source reference, (5) Formatting is consistent throughout.

Final Sign-Off Checklist

Teaching Points

Summary of Skills Created

Document Architecture

Complete Prompt Playbook — Excel Model to Word Report & Board Pack

Prompt 3 — Read and Map the Excel Financial Model

This prompt establishes the data foundation. The trainee instructs Claude to read the Excel financial model and understand its structure before creating any output documents.

Read the Excel financial model workbook currently open. Scan all sheets and identify: (1) the main data table (tbl_Financials) including its column structure (DateKey, EntityKey, AccountKey, DeptKey, ScenarioKey, Amount), (2) the number of entities (Americas, APAC, EMEA), (3) the scenario types (Actual, Budget, Forecast), (4) the date range covered, (5) the chart of accounts (Revenue, COGS, Gross Profit, S&W, Rent, Other OpEx, EBITDA, D&A), and (6) any existing management reports or dynamic extracts. Summarise what you find in a structured format I can reference when building the Word report and PowerPoint board pack.

Why this matters: Every subsequent prompt depends on Claude understanding the source data structure. Without this mapping step, prompts for Word and PowerPoint would need to repeat the data context each time, wasting tokens and increasing error risk.

Prompt 4 — Create Word Report Structure

This prompt creates the skeleton of the Word management report — title page, table of contents, section headings, and page layout — before any data is populated.

Create a professional Accounting and Management Report in this Word document. Set up the following structure: (1) Title page with company name, report title 'Accounting and Management Report', reporting period, and date. (2) Table of Contents (auto-generated from headings). (3) Section headings using Heading 1 and Heading 2 styles: Executive Summary, Financial Performance Overview, Profit & Loss Analysis (with sub-sections for Group Consolidated and each entity — Americas, APAC, EMEA), Variance Analysis (Actual vs Budget, Actual vs Forecast), Key Metrics & KPIs, and Appendix. (4) Set page margins to Normal (2.54cm), use Calibri 11pt body text, and add page numbers in the footer. Do not populate any content yet — structure only.

Why this matters: Establishing the document structure first ensures consistent formatting throughout. Claude can then populate each section methodically, and the TOC updates automatically as content is added.

Prompt 5 — Populate Word Executive Summary & KPIs

This prompt populates the executive summary section with headline KPIs and narrative commentary drawn from the Excel model.

Read the financial model and populate the Executive Summary section of the Word report. Include: (1) A 2–3 paragraph narrative summarising overall financial performance for the reporting period. (2) A KPI summary table with columns for Metric, Actual, Budget, Variance (\$), Variance (%). Include rows for: Total Revenue, Total COGS, Gross Profit, Gross Margin %, Total Operating Expenses, EBITDA, EBITDA Margin %, and Net Profit. (3) Key highlights — bullet points calling out the top 3 positive variances and top 3 negative variances by dollar amount. (4) Entity performance ranking — rank Americas, APAC, and EMEA by Net Profit contribution. Pull all figures from tbl_Financials using ScenarioKey 1 (Actual) and 2 (Budget). Format currency as \$#,##0 with negative values in parentheses.

Why this matters: The executive summary is what senior stakeholders read first. Getting the KPIs right and presenting clear variance commentary sets the tone for the entire report.

Prompt 6 — Build Word P&L Tables & Variance Analysis

This prompt builds the detailed financial tables in the Word report — the P&L breakdown by entity with variance analysis.

Populate the Profit & Loss Analysis section of the Word report. For each entity (Americas, APAC, EMEA) and the Group Consolidated view, create a P&L table with the following structure: Rows for each account (Product Revenue, Services Revenue, Total Revenue, COGS, Gross Profit, Salaries & Wages, Rent & Occupancy, Other OpEx, Total OpEx, EBITDA, D&A, Net Profit). Columns: Actual (\$), Budget (\$), Variance (\$), Variance (%), Forecast (\$), Actual vs Forecast Variance (\$), Actual vs Forecast Variance (%). Add a Variance Analysis sub-section with narrative commentary explaining the key drivers behind material variances (any variance exceeding 10% or \$50,000). Use SUMIFS logic against tbl_Financials to extract the correct figures by EntityKey, AccountKey, and ScenarioKey. Format tables with dark green (#1A3C2E) header rows, white bold text, alternating row shading, and right-aligned numbers.

Why this matters: The P&L tables are the analytical core of the management report. Structured variance commentary transforms raw numbers into actionable insights for decision-makers.

Prompt 7 — Create PowerPoint Board Pack Structure

This prompt shifts to PowerPoint, creating the board pack slide structure with consistent branding before populating data.

Create a Management Reporting Board Pack presentation with the following slide structure: (1) Title Slide — company name, 'Management Reporting & Board Pack', reporting period, presenter name. (2) Agenda Slide — numbered list of sections. (3) Executive Summary — KPI tiles with key metrics. (4) Revenue Overview — group revenue with entity breakdown. (5) Profitability Analysis — gross margin and EBITDA trends. (6) Entity Performance — one slide per entity (Americas, APAC, EMEA) showing individual P&L. (7) Variance Analysis — Actual vs Budget waterfall or comparison. (8) Scenario Comparison — Base vs Budget vs Forecast side-by-side. (9) Key Risks & Opportunities. (10) Recommendations & Next Steps. Use a professional colour scheme: dark green (#1A3C2E) for headers, white backgrounds for content slides, accent green (#4A7C59) for highlights. Set all slides to 16:9 widescreen. Do not populate data yet — structure and layout only.

Why this matters: Board packs follow a predictable structure. Setting up the skeleton with consistent branding means each subsequent prompt can focus purely on data and charts without worrying about layout.

Prompt 8 — Build PowerPoint KPI Dashboard Slide

This prompt creates the executive summary slide with KPI tiles — the single most-viewed slide in any board pack.

Populate the Executive Summary slide with KPI tiles. Read the financial model and create 6 KPI tiles arranged in a 3×2 grid: Total Revenue (Actual \$), Revenue vs Budget (variance %), Gross Margin %, EBITDA (\$), EBITDA Margin %, Net Profit (\$). Each tile should have: a metric label (12pt, grey), the value (28pt, bold, dark green #1A3C2E), and a variance indicator showing ↑ green (#006100) for positive or ↓ red (#9C0006) for negative vs budget. Below the KPI tiles, add a one-line commentary: the single most important insight from the data. Pull all values from tbl_Financials using ScenarioKey 1 (Actual) and 2 (Budget), summed across all entities.

Why this matters: KPI tiles give the board an instant read on performance. The design pattern (metric + value + direction) is universally understood and sets up the detail slides that follow.

Prompt 9 — Create PowerPoint Financial Charts

This prompt builds the data visualisation slides — revenue breakdown, profitability trends, and entity comparison charts.

Create three chart slides in the board pack: (1) Revenue Overview slide: a clustered bar chart showing Total Revenue by entity (Americas, APAC, EMEA) with Actual vs Budget side-by-side. Add a group total annotation. (2) Profitability Trend slide: a combo chart with Revenue as bars and EBITDA Margin % as a line overlay, showing the monthly or periodic trend. (3) Entity Comparison slide: a stacked bar chart showing the P&L waterfall (Revenue → COGS → Gross Profit → OpEx → EBITDA) for each entity side-by-side. For all charts: use the green palette (#1A3C2E, #4A7C59, #D8F3DC), include data labels, set consistent axis formatting (\$#,##0 for currency), and add a one-sentence insight as the slide subtitle.

Why this matters: Charts transform numbers into patterns. A well-designed chart slide communicates in 3 seconds what a table takes 30 seconds to parse. Board members scan charts first, then dive into tables only where they see something unexpected.

Prompt 10 — Build PowerPoint Scenario & Entity Slides

This prompt builds the scenario comparison and individual entity deep-dive slides for the board pack.

Create the following slides: (1) Scenario Comparison slide: a table or grouped bar chart comparing Base (Actual), Budget, and Forecast scenarios across Revenue, Gross Profit, EBITDA, and Net Profit. Highlight the best-performing scenario per metric with bold green. (2) Individual Entity slides (one each for Americas, APAC, EMEA): each slide has a mini P&L table (Revenue through Net Profit), a key variance callout box (top positive and negative variance vs budget), and a 2–3 sentence performance commentary. (3) Risks & Opportunities slide: a two-column layout with Red (risks) on the left and Green (opportunities) on the right, each with 3–4 bullet points drawn from the variance analysis. Use ScenarioKey 1 (Actual), 2 (Budget), 3 (Forecast) from tbl_Financials. Format all currency as \$#,##0.

Why this matters: Entity-level slides give divisional leaders their own performance view. Scenario comparison shows the range of outcomes, which is essential for board-level risk discussion.

Prompt 11 — Format & Polish Both Documents

This prompt applies final formatting and consistency checks to both the Word report and PowerPoint board pack.

Review and polish both documents: Word Report — (1) Ensure all tables have consistent formatting: dark green (#1A3C2E) headers, alternating row shading, right-aligned numbers, left-aligned text. (2) Check that all currency figures use \$#,##0 format with negatives in parentheses. (3) Verify the Table of Contents is current (update field). (4) Add headers showing the report title and footers with page numbers. (5) Ensure all heading styles are consistent (Heading 1 for major sections, Heading 2 for sub-sections). PowerPoint Board Pack — (1) Verify all slides use the same colour scheme and font sizes. (2) Check chart formatting is consistent (same axis scales where comparable, same colour palette). (3) Ensure slide numbers are present. (4) Verify all data labels are readable (not overlapping). (5) Check that the agenda slide matches the actual slide order.

Why this matters: Formatting inconsistency undermines credibility. A board pack where one chart uses blue and another uses green, or a Word report where table headers alternate between styles, signals lack of attention to detail — regardless of how accurate the numbers are.

Prompt 12 — Cross-Validate Against Excel Source

This prompt validates that every number in the Word report and PowerPoint board pack ties back to the Excel source model.

Cross-validate all figures in the Word report and PowerPoint board pack against the Excel financial model. For the Word report: (1) Verify every KPI in the Executive Summary matches the Excel source. (2) Check that each entity P&L table (Americas, APAC, EMEA) totals match SUMIFS against tbl_Financials. (3) Confirm the Group Consolidated figures equal the sum of the three entities. (4) Verify all variance calculations (\$ and %) are arithmetically correct. For the PowerPoint board pack: (1) Check every KPI tile value against the Excel source. (2) Verify chart data points match the underlying data. (3) Confirm scenario comparison figures match ScenarioKey 1, 2, and 3. Report any discrepancies in a summary table showing: Location (document + section/slide), Reported Value, Expected Value (from Excel), Difference.

Why this matters: The single biggest risk in multi-document reporting is numbers drifting between source and output. A cross-validation step catches rounding errors, copy-paste mistakes, and formula misreferences before the report reaches stakeholders.

Prompt 13 — Create Reusable Skills

This prompt creates reusable Claude skills so the entire Word report and PowerPoint board pack workflow can be repeated for future reporting periods with a single command.

Create reusable skills for the workflows we have built: (1) /word-management-report — a skill that reads an Excel financial model and creates the complete Word Accounting and Management Report (structure, executive summary,

P&L tables, variance analysis, formatting). (2) /ppt-board-pack — a skill that reads an Excel financial model and creates the complete PowerPoint Management Reporting Board Pack (slide structure, KPI tiles, charts, entity slides, scenario comparison). (3) /cross-validate-outputs — a skill that reads the Excel model and validates all figures in both the Word report and PowerPoint board pack against the source data. Each skill should include a description of when to use it, the expected inputs, and the step-by-step workflow.

Why this matters: Skills transform a multi-prompt workflow into a single command. Instead of running 10+ prompts each month, the trainee types /word-management-report and the entire report is generated. This is the transition from manual AI usage to automated AI workflows.

Session Flow Summary

Short Form Prompts

Short form prompts combine multiple steps into a single instruction. Use these when you have built out the skills depth, or when time is limited and you want Claude to handle the full workflow in one pass.

These are the equivalent condensed prompts used in the training.

Prompt S1 — Word Management Report (Word document)

Read the Excel financial model (Finance-Demo-Model-Solution-Final.xlsx) and create a complete Accounting and Management Report in this Word document. Include: title page, table of contents, executive summary with 6 KPIs, Group Consolidated P&L table (Actual vs Budget with \$ and % variance), individual entity P&L tables for Americas, APAC, and EMEA, variance commentary explaining the top 3 positive and negative movements, and a formatted appendix listing data sources. Use Calibri 11pt body text, dark green (#1A3C2E) table headers, and \$#,##0 currency formatting throughout.

Prompt S2 — PowerPoint Board Pack (PowerPoint)

Read the Excel financial model and create a Management Reporting Board Pack in this PowerPoint. Include: title slide, agenda, executive summary with 6 KPI tiles (Revenue, Revenue vs Budget %, Gross Margin %, EBITDA \$, EBITDA Margin %, Net Profit \$), revenue overview chart (clustered bar by entity, Actual vs Budget), profitability trend chart (combo: revenue bars + EBITDA margin line), entity performance slides (one per entity with mini P&L and key variance callout), scenario comparison slide (Base vs Budget vs Forecast), and risks & opportunities slide (two-column red/green layout). Use the green palette (#1A3C2E, #4A7C59, #D8F3DC) throughout.

Prompt S3 — Multi-Agent Data Bridge (Word document update)

Connect to the Excel financial model agent and share the following data with this document: (1) Group Consolidated P&L with Actual and Budget columns for all 8 account lines, (2) Entity-level P&L summaries for Americas, APAC, and EMEA, (3) Key KPIs: Total Revenue, Gross Margin %, EBITDA, EBITDA Margin %, Net Profit. Write the data as a JSON file to shared files, then read it here and populate the report tables. Verify every figure ties back to the source by comparing the shared data against SUMIFS on tbl_Financials.

Prompt S4 — Cross-Validation & Final Check (Excel)

Cross-validate every figure in both the Word report and PowerPoint board pack against the Excel financial model. Check: (1) All KPIs match SUMIFS against tbl_Financials, (2) Entity P&L totals sum to the Group Consolidated, (3) All variance calculations are arithmetically correct ($\$ \text{ variance} = \text{Actual} - \text{Budget}$, $\% \text{ variance} = \$ \text{ variance} \div |\text{Budget}|$), (4) Chart data points match the underlying tables. Report any discrepancies as a summary: Location, Reported Value, Expected Value, Difference.

Prompt S5 - Multi skill creator prompt (Excel)

Now create 4 skills based on all those activities between all the agents. Word agent prompt first one, PPT the second, Word again for the 3rd but the new version and 4th the validations. I want all those skills to be created here against foundations so that I can check them and then push them to skills. Label them the training only so they dont get used in my real client workflows
